1. SharePoint: Select a Visio file to display

User should be able to browse and select a Visio diagram from a document library from a website, from his OnDrive folder (in this case the file must be copied to a library), or upload a new file to a SharePoint site (and select target location and upload the file).

The web part should by default show this file using Visio online viewer, with the default settings.

2. SharePoint: Select a file display as full page

User should be able to use "Full Bleed" page. When he creates a new site page, he should be able to select "Diagram Frame" as application (single-page application), and then again select a file to display on that page like in point (1)

The selected diagram should occupy whole page by default.

3. Teams: Select a Visio file to display in a Teams tab

If the web part is deployed to Teams, user should be able to browse and select a file to display in the tab. By default, the file should be displayed full-screen.

4. SharePoint, Teams: Selecting display options

User should be able to change the file display options that are applied on the first load. Default Visio file viewer does not provide these options for Visio, so this is basically the functionality added by the web part.

- **Default zoom** (the file should be zoomed to the specified zoom factor)
- **Width, Height** of the display area. The diagram should occupy the specified space.
- **Turn on/off Visio user interface items**. The diagram should be displayed respectively with or without these items.
  - o Toolbar
  - o Frame
  - o Background
- **Turn on/off diagram interactivity options**, including:
  - o Hyperlink navigation
  - o Pan
  - o Zoom
  - o Pan/Zoom window
